## 2016 Annual Drinking vivaler Quality Note Walls Water Association, Inc. PWS#: 0170019 & 0170043 April 2017

We've pleased to present to you this year's Annuel Quality Water Report. This report is designed to inform you about the quality water and sorvices we deliver to you every day. Our constant goal is to provide you with a safe and dependent supply of drinking water. We want you to understand the efforts we make to confluently improve the water treatment process and protect our water resources. We are committed to providing you with information because informed customers are our best allies. Our water source is from wells

The source water assessment has been completed for our public water system to determine the overall ausceptibility of its drinking water supply to identified potential sources of contamination. A report containing detailed information on how the susceptibility determinations were made has been furnished to our public water system and is available for twelving upon request. The wells for the water system and is available for twelving upon request. The wells for the water water system and is available for twelving upon request. The wells for the water water system and the susceptibility to contemination.

If you have any questions about this report or concerning your water utility, please contact Wade Carter, Manager at 662.781.3722, We want our valued customers to be informed about their water utility. If you have a concern, you can meet with the board, by request at our regularly scheduled meetings. They are held on the fourth Tuesday of the month at 4:00 PM at the Walls Water Office located at 02:00 Goodman Road Walls, MS 36800.

We routinely monitor for conteminants in your drinking water according to Federal and State laws. This table below lists at its the drinking water contaminants that were detected during the period of January 1"to Docomber 3". 2019, in cases where monitoring wasn't required in 2016, the table reflects the most recent results. As water travels over the surface of land or understanding occurring minerals and, in some cases, redioactive materials occurring interactives and the surface of the surface

In this table you will find many terms and abbreviations you might not be familiar with. To help you better understand these terms wa't provided the following definitions:

Action Level - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system statistics.

Maximum Conteminant Level (MCL). The 'Maximum Allowed' (MCL) is the highest level of a conteminant that is allowed in drinkin water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Meximum Conteminant Level Goal (MCLG) - The "Goal"(MCLG) is the level of a contaminant in drinking water below which there is known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Distriction Level Goal (MRDLG) - The level of a dinking water districtions below which there is no know, expected risk of health. MRDLGs do not reflect the benefits of the use of districtions to control microbial contaminants.

Parts per million (ppm) or Millions per litter (mg/l) - one part per million corresponds to one minute in two years or a single penn \$10,000.

Parts per billion (ppb) or Micrograms per Mer - one part per billion corresponds to one minute in 2,000 years, or a single penny \$10,000,000.

Picocuries per liter (pCi/L) - picocuries per liter is a measure of the radioactivity in water.

Most recent sample. No sample regulared for 2016.

\* Fluvride level is routinely adjusted to the MS State Dept of Health's recommended (see 10 ft 9 ft 1.3 mg/l. v/o. nat required to monitor your drinking water for specific constituents on a monthly basis. Results of regular monitoring air discloser of whether or not our drinking water mosts health standards. In an effort to ensure systems complete all monitoring to the property of the propert

If present, elevated levels of lead can cause serious health problems, especially for pregnant woman and young children. Leadrinking water is primarily from materials and components associated with service fines and home plumbing. Our water system responsible for providing high quality dinkingly water, but cannot control the yearily or interface used in plumbing components. We your water has been stiting for severat hours, you can minimize the potential for lead exposure by flushing your top for 30 seconds mituates before using water for dinking or cooking. If you are concerned about lead in your water, you may with to be seconds mituate before using water for dinking or cooking. If you are concerned about lead in your water, you may with to be seconds mituate before using water of dinking or cooking. If you are concerned about lead in your water, you may with to be seconds of the concerned about lead in your water, you may with to be seconds of the concerned and the property of the concerned and the property of the proper

To comply with the "Regulation Governing Fluoridation of Community Water Supplies", the Water Water Association & 017001 comply to proportion of months in the proportion of the Community of th

To comply with the "Regulation Governing Fluoridation of Community Water Supplies", the Walls Water Association — Lake Fore 1770043 is required to report centain results periodining to fluoridation of our water system. The number of moniths in the proviciational year-inst average fluoridic samplas results were within the optimal ranger of 0.7 — 1.3 ppm was 6. The percentage of fluor

All sources of drinking water are subject to potential contamination by substances that are naturally occurring or man made. To substances can be microbes, incriganic or organic chamicals and radioactive substances. All dripking water, including bottler wary reasonably be expected to contain a fleat small amounts of some contaminants. The presence of monitoring the expected of the property of th

Some people may be more vulnerable to conteminants in drinking water than the general population. Immuno-compromised per such as persons with cancer undergoing chemotherapy, persons who have undergone organ tensplants, pellop with HUNAID other immune system disorders/some olderly, and infants can be particularly-at risk from infoctions. These people should seek er about drinking water from their health care providers. EPA/COC guidatines on appropriate means to lessen the risk of infection

The Wells Weter Association works around the clock to provide top quality water to every top. We ask that all our customers he protect our water sources, which are the heart of our community, our way of life and our children's future.

2017 MAY -9 PM 3: 14

2016 Annual Drinking Water Quality Report Walls Water Association, Inc. PWS#: 0170019 & 0170043 April 2017

We're pleased to present to you this year's Annual Quality Water Report. This report is designed to inform you about the quality water and services we deliver to you every day. Our constant goal is to provide you with a safe and dependable supply of drinking water. We want you to understand the efforts we make to continually improve the water treatment process and protect our water resources. We are committed to providing you with information because informed customers are our best allies. Our water source is from wells drawing from the Lower Wilcox Aguifers.

The source water assessment has been completed for our public water system to determine the overall susceptibility of its drinking water supply to identified potential sources of contamination. A report containing detailed information on how the susceptibility determinations were made has been furnished to our public water system and is available for viewing upon request. The wells for the Walls Water Association have received lower to moderate rankings in terms of susceptibility to contamination.

If you have any questions about this report or concerning your water utility, please contact Wade Carter, Manager at 662.781.3722. We want our valued customers to be informed about their water utility. If you have a concern, you can meet with the board, by request at our regularly scheduled meetings. They are held on the fourth Tuesday of the month at 4:00 PM at the Walls Water Office located at 6200 Goodman Road Walls, MS 38680.

We routinely monitor for contaminants in your drinking water according to Federal and State laws. This table below lists all of the drinking water contaminants that were detected during the period of January 1st to December 31st, 2016. In cases where monitoring wasn't required in 2016, the table reflects the most recent results. As water travels over the surface of land or underground, it dissolves naturally occurring minerals and, in some cases, radioactive materials and can pick up substances or contaminants from the presence of animals or from human activity; microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban storm-water runoff, industrial, or domestic wastewater discharges, oil and gas production, mining, or farming; pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm-water runoff, and residential uses; organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations and septic systems; radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities. In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. All drinking water, including bottled drinking water, may be reasonably expected to contain at least small amounts of some constituents. It's important to remember that the presence of these constituents does not necessarily indicate that the water poses a health risk.

In this table you will find many terms and abbreviations you might not be familiar with. To help you better understand these terms we've provided the following definitions:

Action Level - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Maximum Contaminant Level (MCL) - The "Maximum Allowed" (MCL) is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG) - The "Goal" (MCLG) is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL) – The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG) – The level of a drinking water disinfectant below which there is no known or expected risk of health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Parts per million (ppm) or Milligrams per liter (mg/l) - one part per million corresponds to one minute in two years or a single penny in \$10,000.

Parts per billion (ppb) or Micrograms per liter - one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

Picocuries per liter (pCi/L) - picocuries per liter is a measure of the radioactivity in water.

\* Most recent sample. No sample required for 2016.

\*\* Fluoride level is routinely adjusted to the MS State Dept of Health's recommended level of 0.7 - 1.3 mg/l.

We are required to monitor your drinking water for specific constituents on a monthly basis. Results of regular monitoring are an indicator of whether or not our drinking water meets health standards. In an effort to ensure systems complete all monitoring requirements, MSDH now notifies systems of any missing samples prior to the end of the compliance period.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Our water system is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead. The Mississippi State Department of Health Public Health Laboratory offers lead testing. Please contact 601.576.7582 if you wish to have your water tested.

To comply with the "Regulation Governing Fluoridation of Community Water Supplies", the Walls Water Association # 0170019 is required to report certain results pertaining to fluoridation of our water system. The number of months in the previous calendar year that average fluoride samples results were within the optimal ranger of 0.7 - 1.3 ppm was 10. The percentage of fluoride samples collected in the previous calendar year that was within the optimal range of 0.7 - 1.3 ppm was 89%.

To comply with the "Regulation Governing Fluoridation of Community Water Supplies", the Walls Water Association – Lake Forest # 0170043 is required to report certain results pertaining to fluoridation of our water system. The number of months in the previous calendar year that average fluoride samples results were within the optimal ranger of 0.7 – 1.3 ppm was 6. The percentage of fluoride samples collected in the previous calendar year that was within the optimal range of 0.7 -1.3 ppm was 54%.

All sources of drinking water are subject to potential contamination by substances that are naturally occurring or man made. These substances can be microbes, inorganic or organic chemicals and radioactive substances. All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at 1-800-426-4791.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline 1.800.426.4791.

The Walls Water Association works around the clock to provide top quality water to every tap. We ask that all our customers help us protect our water sources, which are the heart of our community, our way of life and our children's future.
